TITLE: A study of the effect of nickel, silicon, and niobium on the oxidation of titanium at high temperatures

SOURCE: Soveshchaniye po metallokhimii, metallovedeniyu i primeneniyu titana i yego splavov, 6th. Novyye issledovaniya titanovykh splavov (New research on titanium alloys); trudy soveshchaniya. Moscow, Izd-vo Nauka, 1965, 148-154

TOPIC TAGS: titanium, titanium alloy, thermal stability, corrosion resistance, nickel, silicon, niobium, metal oxidation, binary alloy, oxidation kinetics

ABSTRACT: The oxidation in air of binary titanium alloys is studied at a temperature range of 800--1200C. The alloys had 1.5, 5 and 10% nickel and silicon, and one had 25% niobium. The alloys were prepared by double melting of electrodes in an electric-arc vacuum furnace. The oxidation kinetics were studied by the method of periodic weighing. The specimens were heated in air for up to 16 hrs at 800--1000C and up to 8 hrs at 1100--1200C. It was found that 1.5% Si in the alloy was optimum for

2

increasing the thermal stability of titanium alloys at high temperatures; a further increase in the Si content decreases the oxidation resistance of the alloys. The introduction of Ni considerably reduces the thermal stability as compared with unalloyed titanium. The introduction of 25% Nb very greatly increases the thermal stability of the alloy, particularly at 1100--1200°. Orig. art. has: 4 figures and 1 table.

TITLE: Effect of hydrogen on clad steels 6

SOURCE: Khimicheskoye i neftyanoye mashinostroyeniye, no. 5, 1966, 12-14

TOPIC TAGS: hydrogen, metal-cladding, stainless steel, corrosion

ABSTRACT: Hydrogen corrosion was studied on tubular specimens of 20 carbon steel clad from within with 1Kh18N9T stainless steel, and on flat specimens of St. 3+0Kh13 and 12MKh+0Kh13 clad steels. Hydrogen was forced into the tubular specimens up to a pressure of 50 kg/cm², and after being sealed, the specimens were kept for 4500 hr at 530°C. The flat specimens were kept in an autoclave at the same hydrogen pressure for 4000 hr at 450-500°C and for 1000 hr at 530°C. In the tubular specimens, a pressure of 5.6 kg/cm² was found to arise between the two layers. Clad 20 steel did not show any corrosion. In the flat specimens, the base layer of St. 3 showed considerable corrosion, but the base layer of 12MKh steel did not. It is concluded that 12MKh+1Kh18N9T clad steel with a proper ratio of the thicknesses of the base and clad layers can be used for building equipment employed in processes of hydrodesulfurization and catalytic re-

TITLE: The effect of hydrogen on the mechanical properties of metals at high temperature and pressure

SOURCE: Khimicheskoye i neftyanoye mashinostroyeniye, no. 12, 1966, 21-26

TOPIC TAGS: ~~hydrogenation, steel, iron, nickel, copper, aluminum, low alloy steel, chromium stainless steel, chromium nickel stainless steel, chromium manganese stainless steel, hydrogen containing steel, high temperature metal property, high pressure metal property~~ high temperature effect

ABSTRACT: Specimens of 20, 12Kh2MFT, 15Kh2MP, Kh3VMF, Kh6VMFB, Kh12VMF, Kh18N9, 1G18Kh8T, 45G18Yu3, 35G12Kh8T, 4Kh12N8GMFB steel, commercial-grade iron, nickel, copper and aluminum have been tested for the effect of hydrogen on their mechanical properties. It was found that at 400-450°C, hydrogen decreases the strength and ductility of 20 steel and iron, particularly during the first 60 hr. Annealing partially restores the ductility. Hydrogen at 500°C and 50 kg/cm² pressure in 1000 hr caused decarburization, loosened grain boundaries and decreased the yield and tensile strengths by 32%, the elongation by 54%, the reduction of area by 72%, and the notch toughness by 92%.

Card 1/2

UDC: 669.1.002.612:546.11

ACC NR: AP7001232

There was no decarburization at 400 or 350C, and subsequently vacuum annealing completely restored the mechanical properties, with the exception of notch toughness. 15Kh2MF and 12Kh2MFT steels tested under 500 kg/cm² pressure at 300 and 450C for 1000, 3000 and 10,000 hr did not show any changes in their structure or mechanical properties. The amount of hydrogen absorbed by these steels did not exceed 12 cm²/100 g. The other steels, on the basis of results obtained by tests at 600C under 700 kg/cm² pressure, can be divided into two groups. The first group includes Kh12VMF, 1G1&Kh8T and Kh6VMFB steels in which hydrogen caused a decrease of mechanical properties, particularly of elongation and notch toughness. However, vacuum annealing at 600C completely restored the mechanical properties to the original level. The second group of alloy steels included 35G12Kh8T and 45G18Yu3 austenitic steels, and Kh3VMF perlitic steel, whose mechanical properties are reduced by hydrogen and are not restored by vacuum annealing. It is believed that this is caused by the action of methene formed by the reaction of absorbed hydrogen with carbon. The mechanical properties of nickel and copper, which were exposed to hydrogen at 700 kg/cm² pressure and at 600C for 100 and 250 hr, dropped and their structure was effected by loosening of the grain boundaries. Aluminum properties and structure were not affected by exposures up to 250 hr to hydrogen under 700 kg/cm² pressure at 300C. Orig. art. has: 8 figures and 4 tables. [TD]

TITLE: Widening the energy range of the Y-120 (U-120) cyclotron

PERIODICAL: Referativnyy zhurnal, Fizika, no. 10, 1962, 4, abstract 10B31
("Rev. phys. Acad. RPR", 1961, v. 6, no. 4, 555 - 565)

TEXT: Described are changes in the h-f oscillator circuit, as well as in the accelerating system and in the system of magnetic field correction, that have been performed on the U-120 cyclotron of the Institut atomnoy fiziki (Atomic Physics Institute) in Bucarest (Rumania) to widen the energy range of accelerated particles. Changes were produced in the oscillator throughout all five power-amplifier stages so that it fully spanned the new frequency range (7.3 - 12.5 Mc), at the same time retaining the energy parameters. The oscillator was practically redesigned and can now be tuned in the frequency range of 5 - 16 Mc. The necessary magnetic field correction was ensured by using central and peripheral shims. It is reported that the achieved widening of the energy range has already permitted experiments to be conducted on low energies (4 Mev/coulomb).

Title : Bibliographical Note

Orig Pub : Probl. zootehn., 1957, No 4, 58

Abstract : In connection with the article by Gligor, Radu and Marinescu on "One-Hoofed Swine in Rumania" (Probleme Zootechnie, No 9, 1956), it is noted that D. Kautenir was the first to write about the existence of one-hoofed swine. The following excerpt is cited from the book "Descriptio Moldaviae" (1714): "In a village of the Tschkatin Orgeyevski Kray, between the courses of the Reut and Ikhil rivers, there live swine whose hooves are not divided into two parts but remain whole like the hooves of horses. The swine brought there from other localities started within three years to give birth to one-hoofed piglets; this resulted from their crossing with both the local livestock and with the animals roaming

in large quantities through the forests and rushes along the course of the Dnestr." This translation is considered by the author to be more accurate and close to Kantenir's Latin text than the translations in the old editions (1851, 1875). Thus, it may be assumed as proved that wild one-hoofed swine had long ago already roamed the territories of Rumania in numerous individual herds or together with two-hoofed swine. It is little probable that monodactylism in swine is the consequence of an atavism. This is refuted by Kantenir's text, from which it can be seen that monodactylism is stable and is transmitted to the progeny, inasmuch as the crossing of one-hoofed with other swine resulted in one-hoofed progeny. -- G.A. Titov.

Title : Prolific Mangalitsa Breed in the Turda Region

Ori; Pub : Probl. Zootehn. si veterin., No 8, 55-57, 1957

Abstract : The Black Mangalitsa Breed of swine is distinguished by its low fertility, with farrows averaging 5-7 piglets. This is caused by, on the one hand, the small number of ova maturing in the ovary and, on the other, the high percentage of mummified foetuses in the uterus. The Turda region is the site of a prolific White Mangalitsa distinguished by its sturdy constitution; the sows have an average live weight of 142.5 kg and farrow 10-14 piglets with an at-birth weight of 0.900 to 1.350 kg. -- V.V. Polovtsova.

Title : Experimental Study of Stimulating Growth Processes and Productivity of Domestic Mammals and Birds with Iodoprotein Hormonization.

Orig Pub: An. Rom.-Sov. Ser. agric.-zootehn., 1957, 11, No. 4, 75-90

Abstract: During 1950-1957, hormonization tests were carried out on hens and ducks, as well as on sheep and swine in which trophogen and iodocasein were administered to the animals in order to stimulate their growth and productivity. It was established that when 0.20g of trophogen was administered daily to hens of the Rhode

Island breed, egg productivity increased by 27.9-38.7 percent, and body weight increased 15-20 percent. Egg weight amounted to 62 g as compared to 60 g in controls. Analogous results were obtained in tests with other hen breeds. Trophogen proved to have an inhibitory effect upon the hatching instinct. Under the influence of trophogen, chicks of the Rhode Island breed displayed plumage hyperpigmentation. Tests carried out on ducks produced the following results: daily 0.10 g doses caused a 17.4 percent increase of egg productivity in one-year-old ducks, and a 7.1 percent increase in egg weight. Tests performed on sheep resulted in improved wool quality, increased milk yields, and greater live weights, as well as in better fodder utilization. When trophogen was administered to swine, increased meat

Abstract: A review of the literature on the effect of cabbage and similar vegetables on the development of thyroid disturbances, especially goiter in wattle and poultry. Presents results of an experiment performed on 15 one-year old Peking ducks and designed to test the effect of cabbage in the diet. It was seen that an effect on the thyroid became evident after about 2 months of cabbage-rich feeding. Therefore, the authors warn against excessive prolonged use of cabbage and suggest iodide salts or potassium iodide to prevent and combat its negative effects.

AUTHOR: Teodoru, V.ORG: Institute of Atomic Physics, Bucharest (Institut atomnoy fiziki)TITLE: Stabilization of accelerating voltage of U-120 cyclotronSOURCE: Pribory i tekhnika eksperimenta, no. 5, 1965, 21-26TOPIC TAGS: cyclotron, electronic circuit

ABSTRACT: After reviewing the gradual development of four successive methods used for stabilizing the dee voltage of the U-120 cyclotron, the author described in detail the fourth improved circuit. The U-120 cyclotron belongs to the Bucharest Institute of Atomic Physics. The evolution of methods was represented in four diagrams of which the fourth one is shown in Fig. 1. This fourth final version had a lower time constant and a high stabilization factor for eliminating the low frequency oscillations (1 to 5 cps). In addition, a phase changer was

included to control the ignition phase of the 10 kv six-phase thyratron rectifier. To control the anode voltage, a plate choke coil was used and its effect on the voltage was explained. The entire arrangement, its tuning and operation was discussed and illustrated by vector diagrams, voltage-phase curves and wiring diagrams. The experiments included the determination of the stabilization factor S_0 and the measurement of the frequency change Δf in the dee oscillation circuit. The experimental results were discussed and presented in tables and curves. The stabilization factor depended upon the circuit parameters and not upon the dee voltage. Under pulsed operation conditions the factor S_0 did not depend upon the duty ratio. The stabilization increased with the increase of amplification in the reactance circuit. The accelerating voltage remained constant in the frequency change range of $\Delta f = 3.6$ kc. This range can be widened two or three times on condition that the ignition phase angle in thyratrons will be decreased by means of a phase changer. The parameters of the circuits and the design data of transformers were given. Gratitude is expressed to M. Makovey and M. Molya for useful advice given and to A. Mitiko and G. Benoyu for their assistance in the apparatus design and construction. Orig. art. has: 14 diagrams.

AUTHOR: Teodosiu, Cristian

TITLE: The solution of the plane problem of the theory of elasticity in the case of some arbitrary body forces

PERIODICAL: Studii și cercetări de mecanică aplicată, v. 13, no. 6, 1962, 1,409 - 1,424

TEXT: The solving of the plane problem of the theory of elasticity in the case of some arbitrary body forces can be reduced to the solving of the same problem in the absence of body forces, provided that a particular solution of a system of equations of the plane problem and a modification of the boundary conditions are determined. Starting with the equations of the static equilibrium, the author establishes the basic equations, which enable a determination of a particular solution of the equation system of the plane problem in the general case of the multiply-connected field and of some body forces, satisfying very wide regularity conditions, by two-dimensional singular integrals in the general case, and by primitive function determinations in the case of body forces whose

Card 1/2

The solution of the plane problem of the

R/008/62/013/006/003/008

components are analytic functions of coordinates. This general method is then applied to two particular cases: body forces deriving from a uniform potential $V(x, y)$; and body forces with analytic components in comparison with the variables x and y . The results obtained are then used in the investigation of the case of a circular collar, subjected to some external stresses given on a frontier, and to some arbitrary body forces with components of x and y analytic functions. The relations developed in the first application, i.e., body forces deriving from an analytic potential, can be simplified, if the potential $V(x, y)$ is uniform and analytic in a simply-connected field D_0 , which completely includes the field D . The author finally examines the possible extensions of the problem studied.

and treat such a system without the use of linearization. The equations of motion of the free vibrations are integrated and the effect of dissipation on the maximum amplitudes and accelerations, and also on their distribution in time, is studied in detail. Methods of the maximum accelerations are calculated and methods for determining the attenuation characteristics from oscillograms are indicated. The conclusions contain a discussion of the shortcomings of linearization methods used at the present time in investigations of such systems and it is pointed out that the use of the present results can eliminate these shortcomings. Orig. art. has: 4 figures, 56 formulas, and 3 tables.
